

Auto led brake light

Generally, [auto brake lights](#) are installed at the end of the vehicle and its main color is red. Its purpose is to remind the following vehicle the previous vehicle will be braked so that it can help to avoid rear-end collision.

There are two kinds of brake lights:

One type is installed at two sides of the end of the auto, it is one kind of tail light.

The other is high beam brake light, it is installed at a high position of the end of the vehicle.

High beam brake light is always square, it is installed on the position much higher than the tail lights. Its purpose is also for reminding the following vehicle. For example, if it is a car with low chassis, if the following vehicle is a truck or bus which is always high, the driver will not easy to see the brake tail light in the front, so at this occasion, a high beam brake light is necessary.

There are many surveys tell us high beam brake light is able to prevent or reduce rear-end collision.

Classification of auto brake lights (by socket type):

A,P21/5W , it is also named BAY15D or 1157 , it is with double wire structure ;

B,W21/5W , also called 7443 , also with double wire structure ;

C,P27/5W , also named 3157 , also with double wire structure ;

The above brake lights are always for warning or position reminding, the power of the brake light should be different when it is used for different function, for example, when P21/5W it is used as a warning light, it requests 21W but when it is used as a position light, is requests 5W.

D, W5W , it is in-line or flat plug, socket type is W2.1×9.5d ;

F, W16W , it is also in-line or flat plug, socket type is W2.1×9.5d ;

D and F is always used in high beam brake light, they are with different measurement and power. W5W is more popular.

The socket type determines the compatibility between vehicle and brake light.
